Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-I-FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithellum. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin (By similarity).

-I-FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased entercoyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the participal target for GLP-2 action. Plays a key role in nutrient because the colon is the colon that the small intestine the stomach to the colon is the subspace of the colon is the colon that the small tract.
                                                                                                                                                                                                                                         PEPTIOS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTW: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decrease mucosal permeability (By similarity).

FUNCTION: Glicentin may modulate gastric acid secretion and gastro-pyloro-duodenal activity (By similarity).

SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   selected neurons in the brain.
INDUCTION: Glucagon release is stimulated by hypoglycemia inhibited by hyperglycemia, insulin, and somatostatin. GLE-GLP-2 are induced in response to nutrient ingestion (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TISSUE SPECIFICITY: Glucagon is secreted in the A cells of the islets of Langerhans. GLP-1, Cayntomodulin and glicentin are secreted from entercendocrine-2, oxyntomotut the gastrointestinal tract. GLP1 and GLP2 are also secreted in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C36118; GCRTDU.

homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-i-FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin (By similarity).

-i-FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased entercoyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in mutrient construction and function as well as increasing nutrient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PubMed=10605628; DOI=10.1210/er.20.6.876; Kieffer T.J., Habener J.F.; "The glucagon-like peptides";

GLP1 and GLP2 are selected neurons in the brain.

INDUCTION: Glucagon release is stimulated inhibited by hyperglycemia, insulin, and s GLP-2 are induced in response to nutrient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         residues at C-terminus as in other mammmals SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTM: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bloactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 ilberates GLP-1, GLP-2, glicentin and oxyncomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                similarity).

-i- FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-i- FUNCTION: GLD-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have

SUBCELLULAR LOCATION: Secreted.

TISSUE SPECIFICITY: Glucagon is secreted in the A cells of the sistets of Langerhans. GLP-1, GLP-2, oxyntomodulin and glicentiates secreted from enteroendocrine cells throughout the gastrointestinal tract. GLP1 and GLP2 are also secreted in selected neurons in the brain.

INDUCTION: Glucagon release is stimulated by hypoglycemia and inhibited by hyperglycemia, insulin, and somatostatin. GLP-1 are induced in response to nutrient ingestion (By similarity)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PTW: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells the major bioactive hormone is glucagon cleaved by PCSKZ/PC2. In the intestinal L cells PCSKI/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decrease mucosal permeability (By similarity).

FUNCTION: Oxyntomodulin significantly reduces food intake (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 similarity)

FUNCTION: Oxyntomodulin significantly reduces food intake.

FUNCTION: Glicentin may modulate gastric acid secretion and the gastro-pyloro-duodenal activity.

SUBCELLULAR LOCATION: Secreted.

- TISSUB SPECIFICITY: Glucagon is secreted in the A cells of the islets of Langerhans. GLP-1, GLP-2, oxyntomodulin and glicentin islets of Langerhans. GLP-1, GLP-2, oxyntomodulin the
                                                                                                                                                                                                                                                                             PTW: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas. SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cell proliferaton. Inhibits beta cell apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin. raises plasma glucose levels in response to insulin-induced hypoglycemia. Plays an important role in initiating and maintaining hyperglycemic conditions in diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gastrointestinal tract.
INDUCTION: Glucagon release is stimulated by hypogly inhibited by hyperglycemia, insulin, and somatostati GLP-2 are induced in response to nutrient ingestion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                glucagon-like peptides.";

homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-!- FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal spithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin (By similarity).

-!- FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestinal growth and up-regulates villus height in the small intestinal growth and up-regulates oxypt cell proliferation and decreased entercoyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in mutrient memosstasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decreases mucosal permeability (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gastro-pyloro-duodenal activity.
SUBCELLULAR LOCATION: Secreted.
FIASUE SPECIFICITY: Glucagon is secreted in the A cells of the islets of Langerhans. GLP-1, GLP-2, oxyntomodulin and glicentin are secreted from entercendocrine cells throughout the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        paccific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells CCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in GLP-1 nor for its affacts on the intestinal cells resulting in the intestinal cells resul
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           residues at C-terminus as in other mammmals SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MISCELLANEOUS: GLP-2 does not have cleavage residues at C-terminus as in other mammmals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      INDUCTION: Glucagon release is stimulated by hypoglycemia and inhibited by hyperglycemia, insulin, and somatostatin. GLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gastrointestinal tract. GLP1 and GLP2 are selected neurons in the brain.

Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of talet neogenesis and pancreatic beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TISSUE SPECIFICITY: Glucagon is secreted in the A cells of the islets of Langerhans. GLP-1, GLP-2, oxyntomodulin and glicentin are secreted from enteroendocrine cells throughout the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cell proliferaton (By similarity).

FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increas crypt cell proliferation and decreased enterocyte apoptosis. I gastrointestinal tract, from the stomach to the colon is the gastrointestinal tract,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).
                                                                                                                                                                                                                                                                                                               similarity).

-i-FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-i-FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cill proliferaton (By similarity).

-I-FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   REVILM.

INDUCTION: Produced in the A cells of the islets of Langerhans in response to a drop in blood sugar concentration.

PTM: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bloactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 liberates GLP-1 and GLP-2. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide (By similarity).

SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     villus height in the small inte

Sequence 6686, Application US/09328352

Patent NO. 6562958

GENERAL INFORMATION:
APPLICANT: GARY L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: GTC99-03PA
                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S

Sequence 19758, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
                                                                                                                                                                                                                                                                                                                                                                 Query Match

GENERAL INFORMATION:

APPLICANT: Cardineau, Guy A.

APPLICANT: Stelman, Steven J.

APPLICANT: Stelman, Steven J.

APPLICANT: Stelman, Steven J.

APPLICANT: Narva, Kenneth E.

TITLE OF INVENTION: Plant-Optimized Genes Encoding Pesticidal Toxins

FILE REFERENCE: MA-714XC2

CURRENT APPLICATION NUMBER: US/09/178,252

CURRENT FILING DATE: 1998-10-23

EARLIER APPLICATION NUMBER: 60/065,215

EARLIER FILING DATE: 1997-11-12

EARLIER FILING DATE: 1998-03-02

NUMBER OF SEQ ID NOS: 27

SOPTWARE: Patentin Ver. 2.0
APPLICANT: Cardineau, Guy A.

PR 0 The invention relates to the use of a glucagon-like peptide-2 (GLP-2) or its variant or homologue for suppressing appetite or inducing satiety. The GLP-2 has the generic formula: X1-H-X2-DGSFSDENNT-X3-LD-X4-LA-X5-X6-DFINWL-X7-X8-TKITD-X9, in which: X1 is absent, or is the spacer peptide DFPERVAIVEELGRR, DFPERVITYEELGRR, DFPERVAIVEELGRR, or a fragment of these; X2 = A or G; X3 = I or V; X4 = N, S or H; X5 = A or T; X6 = R or K; X7 = I or L; X8 = Q or H; and X9 is absent or is K, R, RK, RR or KK. These peptides have a powerful effect on inhibiting food intake when administered peripherally. It is thought that GLP-2 normally released from the intestinal L-cell together with GLP-1 also serves its own distinct role as a peripheral satiety factor. The peptides may be used

                                                                                                                                  The invention relates to the use of a glucagon-like peptide-2 (GLP-2) or CC its variant or homologue for suppressing appetite or inducing satiety. The GLP-2 has the generic formula: x1-H-x2-DSFSDEMNT-X3-LD-X4-LA-X5-X6-CC DFINML-X7-X8-TKITD-X9, in which: X1 is absent, or is the spacer peptide PPDEEVAIVEELGRR, DFPEEVIVEELGRR, DFPEEVAIVEELGRR, or a fragment of these CC ; X2 = A or G; X3 = I or V; X4 = N, S or H; X5 = A or T; X6 = R or K; X7 CC = I or L; X8 = Q or H; and X9 is absent or is K, R, RK, KR, RR or KK.

CC These peptides have a powerful effect on inhibiting food intake when administered peripherally. It is thought that GLP-2 normally released CC from the intestinal L-cell together with GLP-1 also serves its own CC distinct role as a peripheral satiety factor. The peptides may be used CC for the prevention and treatment of disorders associated with impaired CC appetite regulation, specifically obesity and type II diabetes. The present sequence represents one of the spacer peptides in the above CC generic formula. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

These peptides have a powerful effect on inhibiting food intake when administered peripherally. It is thought that GLP-2 normally released from the intestinal L-cell together with GLP-1 also serves its own distinct role as a peripheral satiety factor. The peptides may be used for the prevention and treatment of disorders associated with impaired appetite regulation, specifically obesity and type II diabetes. The prevents sequence represents the above generic formula
The invention relates to the use of a glucagon-like peptide-2 (GLP-2) or its variant or homologue for suppressing appetite or inducing satisty. The GLP-2 has the generic formula: X1-H-X2-DGSFSDEMNT-X3-LD-X4-LA-X5-X6-DFINWL-X7-X8-TKITD-X9, in which: X1 is absent, or is the spacer peptide DFPEEVAIVEELGRR, DFPEEVTIVEELGRR, DFPEEVNIVEELRRR, or a fragment of these; X2 = A or G; X3 = I or V; X4 = N, S or H; X5 = A or T; X6 = R or K; X7
                                                                                                                                         Using glucagon-like peptide(s) for appetite suppression induction - specifically by administering glucagon-like derivatives with glucagon-like peptide-1; used to treat obesity and type II diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the use of a glucagon-like peptide-2 (GLP-2) or its variant or homologue for suppressing appetite or inducing satiety. The GLP-2 has the generic formula: X1-H-X2-DGSFSDEMNT-X3-LD-X4-LA-X5-X6-DFINML-X7-X8-TKITD-X9, in which: X1 is absent, or is the peptide
                                                                                                                                                                                                                                                                                                                      01-MAR-1996;

engineering cells for high level expression, methods of large-scale heterologous protein production, and methods for treatment of disease in vivo using viral delivery systems and recombinant cell lines

Sequence 180

This polypeptide comprises an Arg52Ala mutant of human preproglucagon. The sequence can be expressed from a PCR- amplified mutated cDNA clone (see AAT75673). RIN rat insulinoma cell lines expressing preproglucagon provided efficient amidation of a secreted, processed polypeptide. The invention provides methods for production of heterologous polypeptides using recombinantly engineered cell lines. Also described are methods of
